DufaFeed Broiler Powerstart

Grant your chicks the best possible start for optimal performance and results!

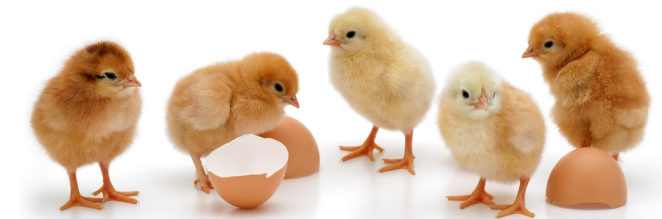

Early nutrition is the key for the whole cycle. Give your broilers a power start and allow them to get the best out of their potential. The improved results will not only be showed during the first weeks of life but also during and at the end of the production cycle.

Characteristics and benefits of our Broiler Powerstart:

- Easily digestible ingredients
- Improved feed intake
- Better uniformity
- Stronger immune system
- Reduced mortality
- Higher slaughter weight
- Better laying performance

DufaFeed Broiler Powerstart is developed for broilers and rearing hens. It improves the animals' early development which results in stronger and healthier birds, improved weight gain and more eggs per bird.

An investment in early nutrition will pay off in the end!

Stimulate feed intake

DufaFeed Broiler Powerstart is a small 2 mm pellet with excellent physical properties in order to stimulate early feed intake during the first days post-hatch. These first days are the crucial days for growth and development of the birds.

Small pellets to stimulate early feed intake

- Supports adaptation from embryonic nutrient supply to exogenous nutrient supply
- Stimulates yolk sac resorption and consequently GIT development
- Quick development of thermo-regulation
- Better immunity development

This complete feed with its specific structure stimulates the broiler eating from the first moment. A faster feed and water intake will result in lower mortality, better population uniformity and extra growth in the first week.

Easily digestible

DufaFeed Broiler Powerstart combines first class raw materials with all essential ingredients. The prestarter feed is easy to digest for the chicks and supplies extra energy, minerals, vitamins, amino acids and most importantly certain additives for enhanced gastrointestinal health.

This special starter feed has been formulated to benefit broilers in terms of reduced mortality and enhanced growth. An anti-coccidial, as well as enzymes and non-antibiotic growth enhancers are included for improved feed conversion, digestion and the reduction of wet droppings.

Boost performance

Healthy growing chicks will become well performing birds. Stimulating the early development of your chicks in the first few weeks is crucial for achieving optimal results later on, for both broilers as layers.

Broilers

In their first week of life, maximum growth occurs, approximately 20% of the total. A strong positive correlation exists between the live weight at the first week and the finishing weight at the end of the production cycle.

DufaFeed Broiler Powerstart will certainly yield:

- Extra growth in the first crucial week
- Higher slaughter weight at the end of the cycle

Trial results between control group and DufaFeed Broiler Powerstart group in a broiler farm in The Netherlands

	control group	Powerstart group
Weight d35 (g)	2338	2385
Growth (g/d)	64.4	65.9
Feed intake (g/d)	95.2	96.6
FCR	1.48	1.47
FCR1500	1.14	1.11
Mortality (%)	16.0	7.6

Rearing hens / layers

In their first weeks of life the basis will be set for their future performance. That's why it is key to prepare your layers for optimal performance:

- Healthy start with better organ and skeleton development, preparing them for laying period
- Higher peak production: extra eggs!
- Healthier birds means less costs, longer production period and more profit!

DufaFeed Broiler Powerstart stimulates:

- Immunity development
- Early development of digestive tract
- Intestinal micro flora
- Organ and skeleton development

Instructions for use

Feed up to 100-150 gram of DufaFeed Broiler Powerstart per chick. The best way is to apply the feed on chickpaper which should be placed under the drinking lines. The rustling sound of birds walking on the paper attracts the attention of the others broilers. This way they have easy access to the feed and drinking water. Chickpaper provides birds with a warmer floor cover and it absorbs droppings quickly, so it keeps the environment of the broilers as hygienic as possible. The chickpaper is bio-degradable so it doesn't need to be removed from the houses, it will disintegrate and break down naturally.

Feeding period:

- Broilers: 0-7 days
- Rearing hens: 0-10 days

Packaging

The DufaFeed Broiler Powerstart is packed in an unique and strong 25kg gas filled poly-propylene bag. Because of the presence of this gas we can eliminate the chance that weevils can hatch.

- Safe for storage
- High quality product
